WAN,  
WLAN,  
VLAN

The diagram illustrates a host system's internal network configuration. On the left, two green boxes represent LXC containers, LXC1 and LXC2. LXC1 has an interface lxcn0 connected to veth0, and LXC2 has an interface lxcn1 connected to veth1. These veth interfaces are connected to a central Linux bridge (yellow box). Inside the bridge, there is a bridge interface br0. The bridge is connected to an external interface eth0 (blue box), which is then connected to a cloud network (cloud shape) labeled LAN, WAN, WLAN, and VLAN.
